Raft - Bug Report - Hook Distance Overwritten

Background:

What is Raft:

Raft is an open-water survival and sandbox game developed by Redbeet Interactive. Players begin stranded on a 2x2 grid of floating planks in an endless ocean. The core gameplay loop revolves around using a starting tool—the Hook—to gather floating debris from the ocean currents. These raw materials (primarily plastic, wood, palm leaves, and barrels) are used to expand the raft, craft survival equipment, and research new technologies while actively managing hunger, thirst, and hostile wildlife.

Component: The Hook

The Hook is the quintessential starting item and the player's primary means of interaction with the world's resources early in the game. The default item granted to the player is the **Plastic Hook**, which can eventually be superseded by the Scrap Hook and the Titanium Hook. Higher-tier variants feature upgraded state speeds, allowing for faster casting, reeling, and underwater mining.

Mechanics & Expected Behavior

- **Charging & Casting:** Holding the primary action input (LMB) charges the throw, calculating the distance the hook will travel. Releasing the button casts the hook outward into the environment.
- **Reeling & Collection:** Holding the action input while the hook is deployed reels it back toward the player. The hook utilizes collision detection to catch floating debris; any gatherable object that intersects with the hook's hitbox or its direct retraction path is grouped and pulled to the player.
- **Action Cancellation:** If the hook is cast improperly or its physical model becomes snagged on the raft's geometry, the player can press the secondary action input (RMB) to immediately cancel the cast and return the tool to an idle state in their hands.

Bug Report:

Bug Description:

When the hook is charged and the left mouse button is clicked right after release the original distance of the throw is overwritten.

Reporter:

rodrigo Araujo lemos

Severity:

The impact level is low, but solving will be easy as it has to do with command reading.

Evidence:

Click on image or Here to view the GIF on GDrive

Steps to reproduce:

1. Equip Hook
2. Hold the left mouse button to charge the hook
3. Release and quickly click the left mouse button
4. Observe the hook distance

Expected Result:

Hook should obey its original charged distance as it has already been thrown.

Observed Result:

Hook distance is overwritten to its base distance.
